

Fork Positioner for Forklifts

Forklift Fork Positioner - The fork positioner is actually a hydraulic device that can allow the person driving to be able to operate the forklift without leaving the seat. They are constructed out of top quality materials and are designed to endure the most challenging procedures and work surroundings. Side shifting units have the extra ability to laterally position the entire load or the arms so as to facilitate much more accurate lifting and position in a faster and more efficient way.

The blade pocket is somewhat unique and enables the person operating it to securely sway the forks into position without any worry of damaging the positioning cylinders. This could allow the driver the option to perform simultaneous or independent fork movement, dependent upon the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages could be transformed into blade positioners on existing units.
